

M. Zion Security Systems Secures Large-Scale Data Center With Millennium

Original Challenge:

Install access control system for large confidential co-location data center, including 200+ interior and perimeter access points, door status monitoring, elevator control, and badging

The Evolution:

Exponential growth including biometric devices and support for multi tenant capability

The Solution:

Upgrade Millennium Expert to Millennium Ultra with:

- Backward compatibility to allow for expansion while still using existing hardware
- Tenants partitioning

“The reliability and flexibility of the Millennium systems makes it the best option for us. We have jobs with hundreds of doors and the reliability of the hardware is hard to beat. We rarely get any hardware repair or replacement calls. The recent integrations and feature rich software upgrades of the Millennium Ultra has greatly improved our productivity.”

**Bruce Brooks, Design Engineer,
M. Zion Security Systems.**

New York based M. Zion Security Systems, one of Millennium’s longest standing security integration partners of over 30 years had a project to install access control security for a major data and co-location center in the Northeast of the United States, and they turned to Millennium.

“This data center site houses multiple clients, and the option provided by Millennium to separate the single site into multi-tenant administrative units while allowing us to still manage it as a single site gave us the upper hand in winning and managing the project,” said Bruce Brooks, Design Engineer at M. Zion Security Systems. “With the tenant option, individual companies can create secure access to their data cages and the common areas. They can also remotely access their partitions with the mobile and web interface options provided by Millennium Ultra software.”

The implementation and management success of this site means that M. Zion continues to see an increase in the installs scope of the project with no near end in sight.

The Result:

A constantly evolving project with the latest addition of 82 access points and the prospect to include more flexible integrations.
