

ATM Access (ATMA) Card System With **SKIM-ASSURE™** Technology

Synergistics's ATMA card access system's unmatched reliability, low cost, and high quality provides the best value for your access control security investments

What is it?

Synergistics's new reader and controller with **SKIM-ASSURE™** technology helps detect skimmers and generates alarms when they are discovered. Our new kits are retrofitted to ensure compatibility with any of our earlier models and our competitors' access control units for easy system upgrades.

What does it do?

SKIM-ASSURE™ technology detects and inhibits skimming operations and generates an alarm in the event of;

- Wire cut,
- Mounting of a skimmer,
- Reader or control tampering,
- Door ajar,
- Auxiliary relay.

How does it work?

Powered by our ATMA management software, it provides low cost remote access to resolve most of your access control support issues. With our software, most service requests can be handled without sending a technician to the field. You get access to status messages from ATMA controllers indicating online/offline, skimmer present, tamper or lighting too low and most alarms can be resolved with the click of a button after a virtual investigation using pre-existing line of sight cameras.
